Electron Micrograph

Image

Image description

Magnification: 297,000X

Bar: 50 nm

Staining: UA

Characteristics

Clear plaques of 0.5mm

Buoyant density in CsCl = 1.515g/mL

Genomic sequence

Deactivated

Propagation conditions

Bacterial hosts

1311

Reference

Von Lohr, R. 1970. Z. Allg. Mikrobiol. 10:269-274. (En allemand/In deutsch)

Remarks

Adsorbs poorly, forms small, irregular, turbid plaques from which lysogens can be isolated.

Prophage is not UV-inducible.

Pre-adsorption to the indicator bacterium is recommended for plating.

Spontaneous clear-plaque mutants are very frequent (10^{-4}) and should be used for preparing high titer lysates.

The phage is able to multiply on *S. marcescens* CV(?).
